

IMAGE DISPLAY SYSTEM AND METHOD

5

ABSTRACT

A method of displaying an image may include receiving image data for the image, and defining first and second sub-frames of the image. The first and second sub-frames may have corresponding pluralities of image elements, with each image element of the second sub-frame spatially offset an offset distance from a corresponding image element of the first sub-frame. The first sub-frame may be displayed in a first position, and the second sub-frame may be displayed in a second position. Each displayed image element of the second sub-frame may be spatially offset substantially the offset distance from the corresponding displayed image element of the first sub-frame.
